

**Listing of Claims**

1. (Currently Amended) An organic electroluminescence display panel, comprising:  
a glass substrate;  
an indium-tin-oxide strip,  
a counter electrode,  
an organic electroluminous layer,  
a cathode strip and  
a seal-cover over the glass substrate, wherein the organic electroluminous layer is formed between the indium-tin-oxide strip and the cathode strip, and the counter electrode has a plurality of first holes and a plurality of second holes, wherein the plurality of first holes are aligned in a first direction ~~at least one of a column direction or a row direction of the counter electrode~~ and the plurality of second holes are aligned in a second direction, wherein the first direction is substantially perpendicular to the second direction.
2. (Previously Presented) The organic electroluminescence display panel according to claim 1, wherein the holes in the counter electrode have a shape which is one of or a combination of a polygon, a cross, or a circle.
3. (Previously Presented) The organic electroluminescence display panel according to claim 1, wherein the counter electrode is formed of a metal including at least one of molybdenum (Mo) or chrome (Cr).

4. (Previously Presented) The organic electroluminescence display panel according to claim 1, further comprising:

an insulating layer between the indium-tin-oxide strip and the cathode strip; and  
a sealant to adhere the seal-cover over the glass substrate, wherein the insulating layer extends to a predetermined area, including a crossing point between the counter electrode and the sealant, and to an area of the glass substrate, so as to be formed on a periphery of the organic electroluminous layer.

5. (Previously Presented) The organic electroluminescence display panel according to claim 3, wherein the cathode strip is formed of a conductive material including at least one of a magnesium (Mg)-silver (Ag) alloy or aluminum (Al).

6. (Currently Amended) A method for fabricating an organic electroluminescence display panel, comprising:

forming an indium-tin-oxide strip on a glass substrate;

forming a counter strip on the indium-tin-oxide strip located in regions other than an emitting region;

patterning the counter strip to have a plurality of first holes and a plurality of

second holes;

forming a first insulating layer on the glass substrate having the indium-tin-oxide strip;  
forming a barrier rib on the insulating layer;  
forming an electroluminescent (EL) layer and a cathode strip in the emitting region; and  
adhering a seal-cover to the glass substrate, wherein the plurality of first holes in the counter strip are aligned in a first direction ~~at least one of a column direction or a row direction of the counter electrode~~ and the plurality of second holes are aligned in a second direction, wherein the first direction is substantially perpendicular to the second direction.

7. (Previously Presented) The method according to claim 6, wherein the counter strip has a width smaller than that of the indium-tin-oxide strip.

8. (Previously Presented) The method according to claim 6, wherein the plurality of holes have a shape which is one of or a combination of a polygon, a cross, or a circle.

9. (Canceled)

10. (Previously Presented) The organic electroluminescence display panel of claim 1, wherein the indium-tin-oxide strip and the cathode strip overlap to form one or more pixel areas, and wherein the counter electrode includes multiple holes in each pixel area.

11. (Currently Amended) The organic electroluminescence display panel of claim 1 [[11]], wherein the counter electrode includes multiple first holes aligned in the first column direction and multiple second holes aligned in the second row direction in each pixel area.

12. (Previously Presented) The method of claim 6, wherein the indium-tin-oxide strip and the cathode strip overlap to form one or more pixel areas, and wherein the counter electrode includes multiple holes in each pixel area.

13. (Currently Amended) The method of claim 12, wherein the counter electrode includes multiple first and second holes aligned in the first column direction and second row direction in each pixel area.

14. (Currently Amended) An organic electroluminescence display panel, comprising:  
a first electrode layer;  
an organic electroluminous layer;  
a counter electrode having a plurality of first holes and a plurality of second holes; and;  
a second electrode layer, wherein the organic electroluminous layer and the counter electrode are between the first and second electrode layers, and the plurality of first holes of the counter electrode are aligned in a first direction ~~at least one of a first direction or a second direction~~ and the plurality of second holes are aligned in a second direction, wherein the first direction is substantially perpendicular to the second direction.

15-16 (Canceled)

17. (Previously Presented) The organic electroluminescence display panel of claim 14, wherein the first electrode layer is an anode layer and the second electrode layer is a cathode layer.

18. (Previously Presented) The organic electroluminescence display panel of claim 14, wherein the holes in the counter electrode have a shape which is one of or a combination of a polygon, a cross, or a circle.

19. (Previously Presented) The organic electroluminescence display panel of claim 14, wherein the counter strip has a width smaller than that of the first electrode layer.

20. (Previously Presented) The organic electroluminescence display panel of claim 14, wherein the first electrode layer and second electrode layer overlap to form one or more pixel areas, and wherein the counter electrode includes multiple holes in each pixel area.

21. (Currently Amended) The organic electroluminescence display panel of claim 20, wherein the counter electrode includes multiple first holes aligned in the first direction and multiple second holes aligned in the second direction in each pixel area.

22. (Previously Presented) The organic electroluminescence display panel according to claim 14, further comprising:

an insulating layer between the first and second electrode layers; and

a sealant to adhere a seal-cover over a substrate over which the first electrode layer is formed, wherein the insulating layer extends to a predetermined area where the counter electrode overlaps the sealant.

23. (Previously Presented) The organic electroluminescence display panel according to claim 14, wherein the holes have a same shape.

24. (Currently Amended) A method for fabricating an organic electroluminescence display panel, comprising:

forming a first electrode layer on a substrate;

forming a counter electrode over the first electrode layer;

forming an electroluminous layer over the counter electrode; and

forming a second electrode layer over the electroluminous layer, wherein the counter electrode has a plurality of first holes and a plurality of second holes, wherein the plurality of first holes are aligned in a first direction and at least one of a first direction or a second direction the plurality of second holes are aligned in a second direction, wherein the first direction is substantially perpendicular to the second direction.

25. (Canceled)

26. (Previously Presented) The method of claim 24, wherein the holes in the counter electrode have a shape which is one of or a combination of a polygon, a cross, or a circle.

27. (Previously Presented) The method of claim 24, wherein the first electrode layer and second electrode layer overlap to form one or more pixel areas, and wherein the counter electrode includes multiple holes in each pixel area.

28. (Currently Amended) The organic electroluminescence display panel of claim 24, wherein the counter electrode includes multiple first holes aligned in the first direction and multiple second holes aligned in the second direction in each pixel area.

29. (New) The organic electroluminescence display panel according to claim 1, wherein portions of the counter electrode are located between adjacent pairs of the first holes aligned in the first direction, and portions of the counter electrode are located between adjacent pairs of the second holes aligned in the second direction.

30. (New) The organic electroluminescence display panel according to claim 1, wherein each of the first holes and the second holes has one of the following shapes: a triangle, a circle, a cross, or a polygon having more than four sides.
